GENERAL LAND OFFICE

TABLES AND FORMULAS

FOR THE USE OF

U. S. SURVEYORS AND ENGINEERS

ON

PUBLIC LAND SURVEYS

A SUPPLEMENT TO THE
MANUAL OF SURVEYING INSTRUCTIONS 0

COMPILED UNDER THE DIRECTION OF

FRED DENNETT

COMMISSIONER OF THE GENERAL LAND OFFICE

WASHINGTON #

2) GOVERNMENT PRINTING OFFICE #

3) 1910

United States surveyors and engineers, and all others who may find it convenient to use the tables included in this volume, are requested to report to the Commissioner of the General Land Office, Washington, D. C., any errors detected in the tables as printed.

CONTENTS.

No.	Page.
1. Units of linear measure, units of area expansion of steel tapes, and conversion tables chains to feet and feet to chains.....	5
2. Reduction in latitude to south boundary of township, and corrections for convergency within a township.....	6
3. Traverse table, for the correction of random lines.....	7
4. Traverse tables.....	8
5. Correction of error in stadia wire interval.....	98
6. Stadia coefficients, vertical rod.....	99
7. Natural sines and cosines.....	106
8. Natural tangents and cotangents.....	115
9. Logarithmic sines, cosines, tangents, and cotangents.....	127
10. Logarithms of numbers.....	172
11. Convergency of meridians, and differences of latitude and longitude.....	199
12. Azimuths of the tangent to the parallel.....	200
13. Offsets from the tangent to the parallel.....	201
14. Azimuths of the secant.....	202
15. Offsets from the secant to the parallel.....	203
16. Lengths of arcs of the earth's surface.....	204
17. Apparent time of sunrise and sunset.....	205
18. Conversion tables, degrees to time, and time to degrees.....	206
19. Sidereal conversions, and reductions to the local mean time of upper culmination of Polaris.....	207
20. Mean refractions in zenith distance.....	208
21. Coefficients to apply to mean refractions for variations in barometer and temperature.....	209
22. Coefficients for computing errors in azimuth, due to small errors in declination or latitude.....	210
23. Mean refractions in polar distance.....	211
24. Trigonometric formulas for the solution of plane triangles.....	218
25. Trigonometric formulas for the solution of stadia measurements, observations for time, latitude, and azimuth, and problems in convergency.....	220

Standard Field Tables.

TABLE 1.—UNITS OF MEASURE, ETC.

UNITS OF LINEAR MEASURE.

1 chain= 100 links.
 = 66 feet.
 1 mile = 80 chains.
 = 5,280 feet.

UNITS OF AREA.

1 acre= 10 square chains.
 = 43,560 square feet.
 1 square mile= 640 acres.

EXPANSION OF STEEL TAPES.

The coefficient of expansion of steel tapes=0.000065 for 1° F.

CONVERSION TABLES.

Chains to feet.

47 30	46.818	70 0	23.729	70	69.324

The lengths of degrees of the meridian are tabulated to correspond to the length of the arc of which the tabulated latitude is the middle, thus the quantity 68.993, opposite latitude 40° 0' is the number of miles between latitude 39° 30' and 40° 30'.

The above table is an abridgment of a table published by the U. S. Coast and Geodetic Survey based on the values of the Clarke spheroid.

TABLE 17.—APPARENT TIME OF SUNSET FOR N. DECLINATIONS, OR SUNRISE FOR S. DECLINATIONS.

	Hours.								

Sidereal into mean solar time: To be subtracted from a sidereal time interval: Argument hours and minutes of sidereal interval.

Mean Solar into sidereal time: To be added to a mean time interval: Argument hours and minutes of mean time interval.

Upper culmination of Polaris: Amount to be subtracted from the Greenwich mean time of upper culmination of Polaris, or of elongation, to obtain the local mean time of upper culmination, or of elongation: Argument longitude west from Greenwich.

The above table is an abridged mean of two tables given in the American Ephemeris and Nautical Almanac for similar conversions; reductions involving a refinement exceeding 0.8 seconds must be made from the more elaborate tables.

Any true refraction either in zenith or polar distance = tabulated refraction \times coefficient for barometric pressure \times coefficient for temperature.

The differences between the true and the tabulated refractions are generally small and generally negligible excepting for the combined effect of low apparent altitude of observation with high elevation above sea level or extremes of temperature.

The coefficients for noon become infinitely large.

Direction of errors in azimuth from true south:

To the east in the a. m., to the west in the p. m.—

Latitude set or assumed to the N. of the true latitude, noon to six hours.

Latitude set or assumed to the S. of the true latitude, beyond six hours.

Declination set or assumed to the S. of the true declination, all hours.

To the west in the a. m., to the east in the p. m.—

Latitude set or assumed to the S. of the true latitude, noon to six hours.

Latitude set or assumed to the N. of the true latitude, beyond six hours.

Declination set or assumed to the N. of the true declination, all hours.

The error is considered as the erroneous fixation of the south point.

TABLE 24.—TRIGONOMETRIC FORMULAS FOR THE SOLUTION OF PLANE TRIANGLES.

Let $A = \text{angle } BAC = \text{arc } BF$, and let the radius $AF = AB = AH = 1$. We then have

- $\sin A = BC$
- $\cos A = AC$
- $\tan A = DF$
- $\cot A = HG$
- $\sec A = AD$
- $\text{cosec } A = AG$
- $\text{versin } A = CF = BE$
- $\text{covers } A = BK = HL$
- $\text{exsec } A = BD$
- $\text{coexsec } A = BG$
- $\text{chord } A = BF$
- $\text{chord } 2A = BI = 2BC$

In the right-angled triangle ABC
 Let $AB = c$, $AC = b$, and $BC = a$.
 We then have:

TABLE 25.—TRIGONOMETRIC FORMULAS FOR THE SOLUTION OF STADIA MEASUREMENTS, OBSERVATIONS FOR TIME, LATITUDE AND AZIMUTH, AND PROBLEMS IN CONVERGENCY.

NOTATION.

“THE EPHEMERIS.”

“Ephemeris of the Sun and Polaris, and Tables of Azimuths of Polaris,” prepared under the direction of the Commissioner of the General Land Office.

“ \approx ”: The symbol for approximation.

“ v .”

Observed vertical angle; in altitude observations on the sun, the reductions to the sun's center both vertically and horizontally, as well as instrumental errors, are eliminated by taking direct and reversed observations on the opposite limbs of the sun, and the mean observed vertical angle to the sun's center is to be considered “ v ” in the notation. In single observations the vertical reduction to the sun's center = $16'$; a refinement is had by referring to the Ephemeris for the value of the sun's semidiameter for the date of observation.

“ h .”

True vertical angle to the sun's center, or to Polaris, in altitude observations, after correction for refraction; $h = v -$ refraction in zenith distance; a refinement is had in altitude observations on the sun by adding the value of the sun's parallax = $8''.9 \cos v$, opposite in effect to refraction.

“ ζ .”

Zeta: True zenith distance of the sun's center.

$$\zeta = 90^\circ - h.$$

“ ϕ .”

Phi: Latitude of the station of observation.

“ λ .”

Lambda: Longitude of the station of observation.

“ δ .”

Delta: Declination of the sun or Polaris; to be taken from the Ephemeris for the date of observation; the declination of the sun is to be corrected in hourly difference to the longitude of the station and to the time of observation: north declinations are treated as positive and south declinations as negative; a northerly hourly motion is treated as positive and a southerly hourly motion is treated as negative; in the use of the solar attachment the declination of the sun is to be corrected for refraction in polar distance, always north.

“ A .”

Azimuth angle from the true meridian to Polaris, or to the sun's center; in the following analytical solutions “ A ” is referred to the north point unless otherwise modified, and the reductions are symmetrical either east or west of the meridian; all determinations for azimuth imply the recording of horizontal angles from a fixed reference point to Polaris or to the sun, or a point marked on the ground to define the direction of observation, the mean horizontal angle, or the mean point in direction, being used in the determination; in single observations on the sun, the reduction to the sun's center in azimuth = $\frac{16'}{\cos v}$; a refinement in the value of the sun's semidiameter is had by referring to the Ephemeris for the date of observation.

SIGNS OF TRIGONOMETRIC FUNCTIONS.

FIG. 3.

STADIA MEASUREMENTS.

Hor. dis.: The true horizontal distance from the center of the instrument to the rod.

Diff. elev.: The true vertical distance from the height of the instrument to the center point between the two targets of the rod.

“*r*”: Vertical rod reading.

“*K*”: The wire interval or ratio, to be determined in the field by frequent tests under working conditions in comparison with steel tape measurement, solving the formula given below for “*K*,” hor. dis. known.

“*c*”: Distance from the center of the instrument to the object glass.

“*f*”: Distance from the plane of the cross-wires to the object glass.

$$\text{Hor. dis.} = K r \cos^2 v + (c + f) \cos v.$$

$$\text{Diff. elev.} = K r \frac{1}{2} \sin 2 v + (c + f) \sin v.$$

In public land surveying it is convenient to have fixed stadia wires with a ratio of 1:132 so that the sum of two rod readings in feet will be equivalent to a ratio of 1:66, or a reduced distance in chains; it is also convenient to reduce the error in the wire interval to the error in 10 chs., and to eliminate the error by applying to the reduced distance the proper amount taken from the table of proportional parts. With a ratio of 1:100, using a rod graduated to links, the elimination of the error in the wire interval is conveniently made in the same manner. With a ratio of 1:100, using a rod graduated to feet, the reduction is simplified by determining the logarithm of the true “*K*,” rod in feet and horizontal distance in chains units, accomplishing the reduction of $K r \cos^2 v$ by logarithmic functions.

TIME.

Conversion of standard time into local mean time.—Watch reading \pm watch error in standard time by comparison \pm correction for longitude; the correction for longitude is additive east and subtractive west of the standard meridian of the time belt; the conversion table “degrees to time” is convenient in this reduction.

Conversion of apparent time into local mean time.—Apparent time of observation \pm the equation of time; the equation of time is to be taken from the Ephemeris for the date of observation and corrected for the longitude and time of observation, conveniently interpolated as the interval from Greenwich noon to the time of observation;

the watch error in local mean time is then found by taking the difference between the watch reading at the epoch of the observation and the reduced local mean time of observation.

Local mean time of upper culmination of Polaris.—The Greenwich mean time of upper culmination of Polaris is to be taken from the Ephemeris for the date of observation; the amount to be subtracted from the Greenwich mean time of upper culmination of Polaris to obtain the local mean time of upper culmination of Polaris, in which the argument is the longitude west from Greenwich, is obtained from the table of sidereal conversions without computation.

Local mean time of elongation of Polaris.—The mean time of elongation of Polaris, Greenwich meridian, latitude 40° , is to be taken from the Ephemeris for the date of observation; the amount to be subtracted from the mean time of elongation of Polaris, Greenwich meridian, latitude 40° , to obtain the mean time of elongation of Polaris, local meridian, latitude 40° , in which the argument is the longitude west from Greenwich, is obtained from the table of sidereal conversions without computation. The amount to apply to the local mean time of elongation of Polaris latitude 40° to obtain the local mean time of elongation of Polaris latitude of observation is tabulated in the Ephemeris in connection with the table of azimuths of Polaris at elongation.

Conversion of a mean time interval into a sidereal time interval, or vice versa.—The amount to apply to one time interval to obtain the other time interval is obtained from the table of sidereal conversions without computation.

Hour angles of Polaris.—A mean time hour angle of Polaris west of the meridian is the mean time interval from the local mean time of upper culmination of Polaris to the local mean time of observation of Polaris; a mean time hour angle of Polaris east of the meridian is the mean time interval from the local mean time of observation of Polaris to the local mean time of upper culmination of Polaris.

Mean time hour angle of Polaris at elongation.—“ t ” = the sidereal hour angle in angular measure, this converted into time measure, and this in turn converted from a sidereal time interval into a mean time interval gives the mean time hour angle of Polaris at elongation:

$$\cos t = \cotan \delta \tan \phi$$

Altitude observation of the sun for apparent time.—“ t ” = hour angle from apparent noon in angular measure; reverse the signs of “ δ ” for south declinations:

$$\tan \frac{1}{2} t = \sqrt{\frac{\sin \frac{1}{2} (\zeta + \phi - \delta) \sin \frac{1}{2} (\zeta - \phi + \delta)}{\cos \frac{1}{2} (\zeta + \phi + \delta) \cos \frac{1}{2} (\zeta - \phi - \delta)}}$$

Meridian observation of the sun for apparent noon.—With the telescope in the meridian elevated to the sun’s altitude, the watch times of transit of the sun’s west and east limbs are noted, the mean of which is the watch time of apparent noon; if the observation fails for either limb the reduction to the sun’s center is accomplished by adding or subtracting 68 seconds; a refinement in the amount of this time is had by referring to the Ephemeris for the time of the sun’s semidiameter passing the meridian for the date of observation; the setting for the approximate altitude of the sun’s center is:

$$V \approx 90^\circ - \phi \pm \delta$$

LATITUDE.

Meridian altitude observation of the sun for latitude.—Reverse the sign of “ δ ” for south declinations:

$$\phi = 90 + \delta - h$$

This observation is conveniently combined with the meridian observation of the sun for time, observing simultaneously the sun’s lower and west limbs, recording the watch time and the vertical angle and reversing in the interval of about $2\frac{1}{2}$ min-

utes, and observing simultaneously the sun's upper and east limbs; the settings for the approximate altitudes of the sun's lower and upper limbs, respectively, are:

$$v \neq 90^\circ - \phi \pm \delta \mp 16'$$

Altitude observation of Polaris at upper culmination for latitude.—

$$\phi = h + \delta - 90^\circ$$

Altitude observation of Polaris at lower culmination for latitude.—The mean time hour angle of Polaris at lower culmination is 11 hours 58 minutes 2 seconds:

$$\phi = h + 90^\circ - \delta$$

The settings for the approximate altitude of Polaris at upper and lower culminations, respectively, are:

$$v \neq \phi \pm (90^\circ - \delta)$$

AZIMUTH.

Altitude observation of the sun for azimuth.—Reverse the signs of “ δ ” for south declinations:

$$\tan \frac{1}{2} A = \sqrt{\frac{\cos \frac{1}{2} (\zeta + \phi + \delta) \sin \frac{1}{2} (\zeta + \phi - \delta)}{\cos \frac{1}{2} (\zeta - \phi - \delta) \sin \frac{1}{2} (\zeta - \phi + \delta)}}$$

The spherical angles “ ζ ,” “ ϕ ,” and “ δ ” appear in this equation combined as in the formula for the reduction of an altitude observation of the sun for apparent time, and when it is desired to reduce for both time and azimuth, the above equation for azimuth is to be preferred to any that follow.

Altitude observation of the sun for azimuth.—For south declinations the function “ $\sin \delta$ ” becomes negative by virtue of the sine of a negative angle being treated as negative in analytical reductions: If the algebraic sign of the result is positive the azimuth “ A ” is referred to the north point, but if negative, the azimuth “ A ” is referred to the south point:

$$\cos A = \frac{\sin \delta}{\cos \phi \cos h} - \tan \phi \tan h$$

The above equat'on is very convenient in reducing for azimuth only.

Altitude observation of the sun for azimuth.—To many surveyors the following equation is familiarly expressed directly in terms of the spherical triangle “pole-zenith-sun”: reverse the sign of “ δ ” for south declinations:

$$\begin{aligned} \text{Pole to zenith} &= 90^\circ - \phi = \text{colat.}; \\ \text{Pole to sun} &= 90^\circ - \delta = \text{codecl.}; \\ \text{Zenith to sun} &= 90^\circ - h = \text{coalt.}; \\ S &= \frac{1}{2} \text{sum of the three sides:} \end{aligned}$$

$$\cos \frac{1}{2} A = \sqrt{\frac{\sin S \sin (S - \text{codecl.})}{\sin \text{colat.} \sin \text{coalt.}}}$$

Equal altitude observations of the sun for meridian.—The sun's center at equal altitudes occupies symmetrical positions in azimuth east and west of the meridian in the morning and in the afternoon except for the correction necessary to be applied due to the change in the sun's declination in the interval between the a. m. and p. m. observations:

“ $d A_3$ ”: Correction in azimuth in minutes of angular measure to be applied to the mean position in azimuth to obtain the true south point; the correction is to be applied to the east with a northerly hourly change in declination, or to the west with a southerly hourly change.

“ $d \delta$ ”: Change in declination of the sun from the a. m. to the p. m. observation, expressed in minutes of angular measure.

" (t_1+t_2) ": The sum of the hour angles from apparent noon, or the total watch time from the a. m. to the p. m. observation, expressed in angular measure.

$$d A_{\delta} = \frac{\frac{1}{2} d \delta}{\cos \phi \sin \frac{1}{2} (t_1+t_2)}$$

The symmetry of the equal altitude observation is preserved by observing opposite limbs in azimuth in the a. m. and p. m. observations, in connection with the same limb in vertical angle in both observations.

With " $\frac{1}{2} d \delta$ " and " $\frac{1}{2} (t_1+t_2)$ " calculated, the computation can be concluded by applying to " $\frac{1}{2} d \delta$ " the declination coefficient obtained by entering the table of coefficients for computing errors in azimuth due to small errors in declination, arguments: " ϕ " and " $\frac{1}{2} (t_1+t_2)$."

Azimuth of Polaris at elongation.—

$$\sin A = \frac{\cos \delta}{\cos \phi}$$

A table of azimuths of Polaris at elongation, for latitudes from 25° to 70° N., appears in the Ephemeris, arguments: " δ " and " ϕ ."

Azimuth of Polaris at any hour angle.—" t "=sidereal hour angle in angular measure; in hour angles exceeding 90° the function " $-\sin \phi \cos t$ " becomes positive by virtue of the cosine of an angle between 90° and 270° being treated as negative in analytical reductions:

$$\tan A = \frac{\sin t}{\cos \phi \tan \delta - \sin \phi \cos t}$$

A table of azimuths of Polaris at all hour angles, for latitudes from 30° to 50° N., appears in the Ephemeris, arguments: " δ ," mean time hour angle, and " ϕ ."

For other than the above latitudes the surveyor will be required to perform the above analytical solution, accomplished by the following process: convert the usual mean time hour angle into sidereal hour angle, and convert the sidereal hour angle into angular measure to obtain " t " for the above equation.

Polaris at sunset or sunrise.—Polaris is conveniently observed for azimuth by the hour angle method at sunset or sunrise without artificial illumination; the preparation for the observation consists in computing in advance the approximate settings in azimuth and altitude in order to find Polaris, and the plan contemplates an approximate reference meridian: with the time of sunset or sunrise assumed as the time of observation, the hour angle " t " and azimuth " A " are determined in order to find the position of Polaris in azimuth; the position in altitude is found by the following approximation, the positive sign being used for hour angles less than 6 hours, and the negative sign for hour angles exceeding 6 hours:

$$v \approx \phi \pm 70' \cos t$$

CONVERGENCY OF MERIDIANS.

" m_{λ} ": Measurement along the parallel.

" m_{ϕ} ": Measurement along the meridian.

" a ": Equatorial radius of the earth = 3963.3 miles = 80×3963.3 chains.

" e ": Factor of eccentricity, $\log e = 8.915\ 2515$.

" dm_{λ} ": Linear amount of the convergency on the parallel, of two meridians distance apart " m_{λ} ," and distance " m_{ϕ} " along the meridian: " dm_{λ} ," " m_{λ} ," " m_{ϕ} " and " a " to be expressed in the same unit:

$$dm_{\lambda} = \frac{m_{\lambda} m_{\phi}}{a} \tan \phi \sqrt{1 - e^2 \sin^2 \phi}$$
